

A customer, with 11 sites in London was spending over £145,000 per annum on the removal of general waste from their sites. After surveying the sites and collating collection data, we were able to establish that by installing mobile compactors at the sites we could reduce the number of “up lifts” of waste from the locations thereby reducing the costs to the customer from day one. With ever increasing haulage costs, this was a cost that would only increase over time. Additionally this solution was both practical and efficient for the customer and enabled the sites to be kept cleaner and tidier. The customer also took out a five year maintenance plan with each of the pieces of equipment. This covered servicing, parts and labour maintenance, meaning that the customer had no hidden or unexpected costs.

The graph below shows the savings (and anticipated savings) that we were able to achieve for the customer over the five year rental term for the equipment. As you will see the customer would save £38,000 a year in the first year and as transportation costs increase the savings would become even larger, totaling over £275,000 in the five year period. Definitely costs worth saving!!

Graph to Show Customer's Projected 5 Year Waste Disposal Cost for Current Solution Compared with Pearce Compaction Systems Ltd Proposal
